Super Admin — Tables, Relationships & Explanations

Version 1.0 | **Date** 29 Jul 2026 | **Confidential**

© 2026 GlowTap

1. Purpose

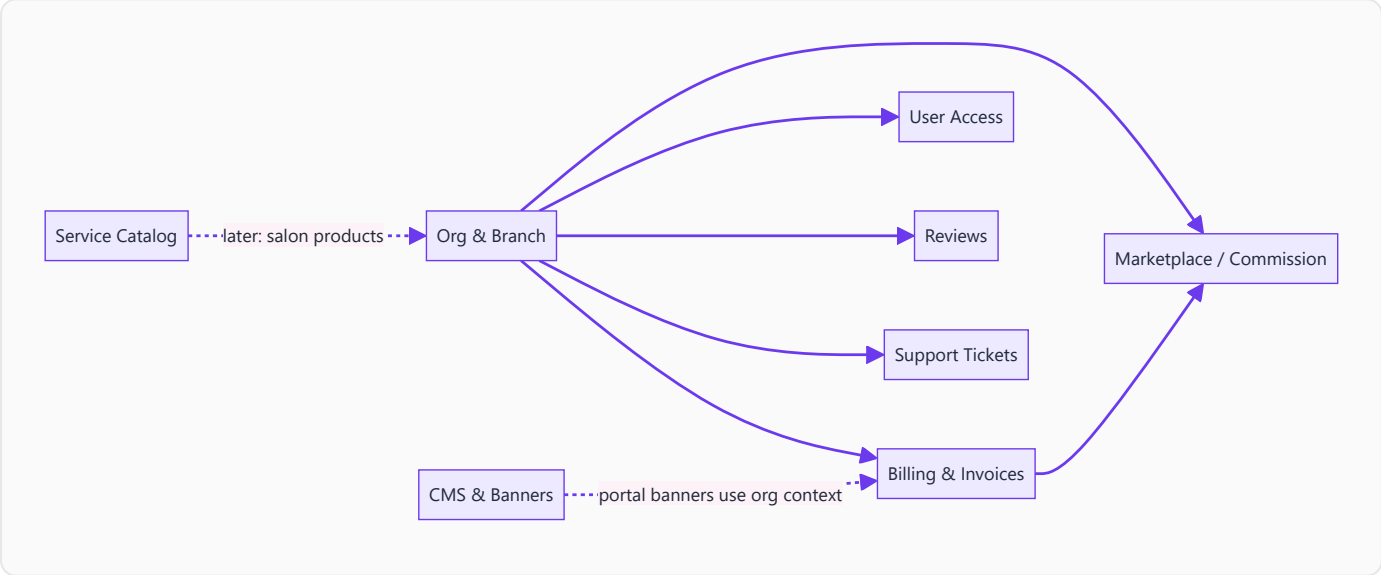

This document describes the **Neon Postgres** schema used by the GlowTap **Super Admin** platform: entities, relationships (ER), and how each domain works in practice.

The schema is organized into **domains**. Each section has:

1. A short explanation
2. An **ER diagram** (Mermaid)
3. Table roles

> Soft references such as `booking_ref` / `end_user_ref` are intentional until Booking and End-User modules exist as first-class tables.

2. Domain map (high level)

Domain	Tables (approx.)	Purpose
Core	organizations, branches, states, super_admin_users	Hierarchy & platform operators
Billing	plans, cycles, org_bill_structure, invoices, payments…	SaaS subscription money
Marketplace	end_user_transactions, ledger, payouts…	B2C GMV, commission, salon payout
Access	sub_admins, modules, branches access	Salon Admin / Sub Admin
CMS	cms_*, portal_banners	Website + salon portal promos
Reviews	reviews, moderation_*	Ratings moderation
Support	support_*	Tickets from salon + customer
Catalog	service_categories / subcategories	Platform taxonomy

53 tables · 132 foreign keys · 261 indexes (as of migration 053).

3. Core — Organization & Branch

Explanation

GlowTap is **Organization** → **Branch**.

An **organization** is the salon business; a **branch** is a physical outlet. Super Admin users approve orgs/branches and manage platform config.

`organizations.owner_*` doubles as the **Salon Admin** profile (no separate main-admin table). Portal login gate uses `owner_portal_status`.

ER diagram

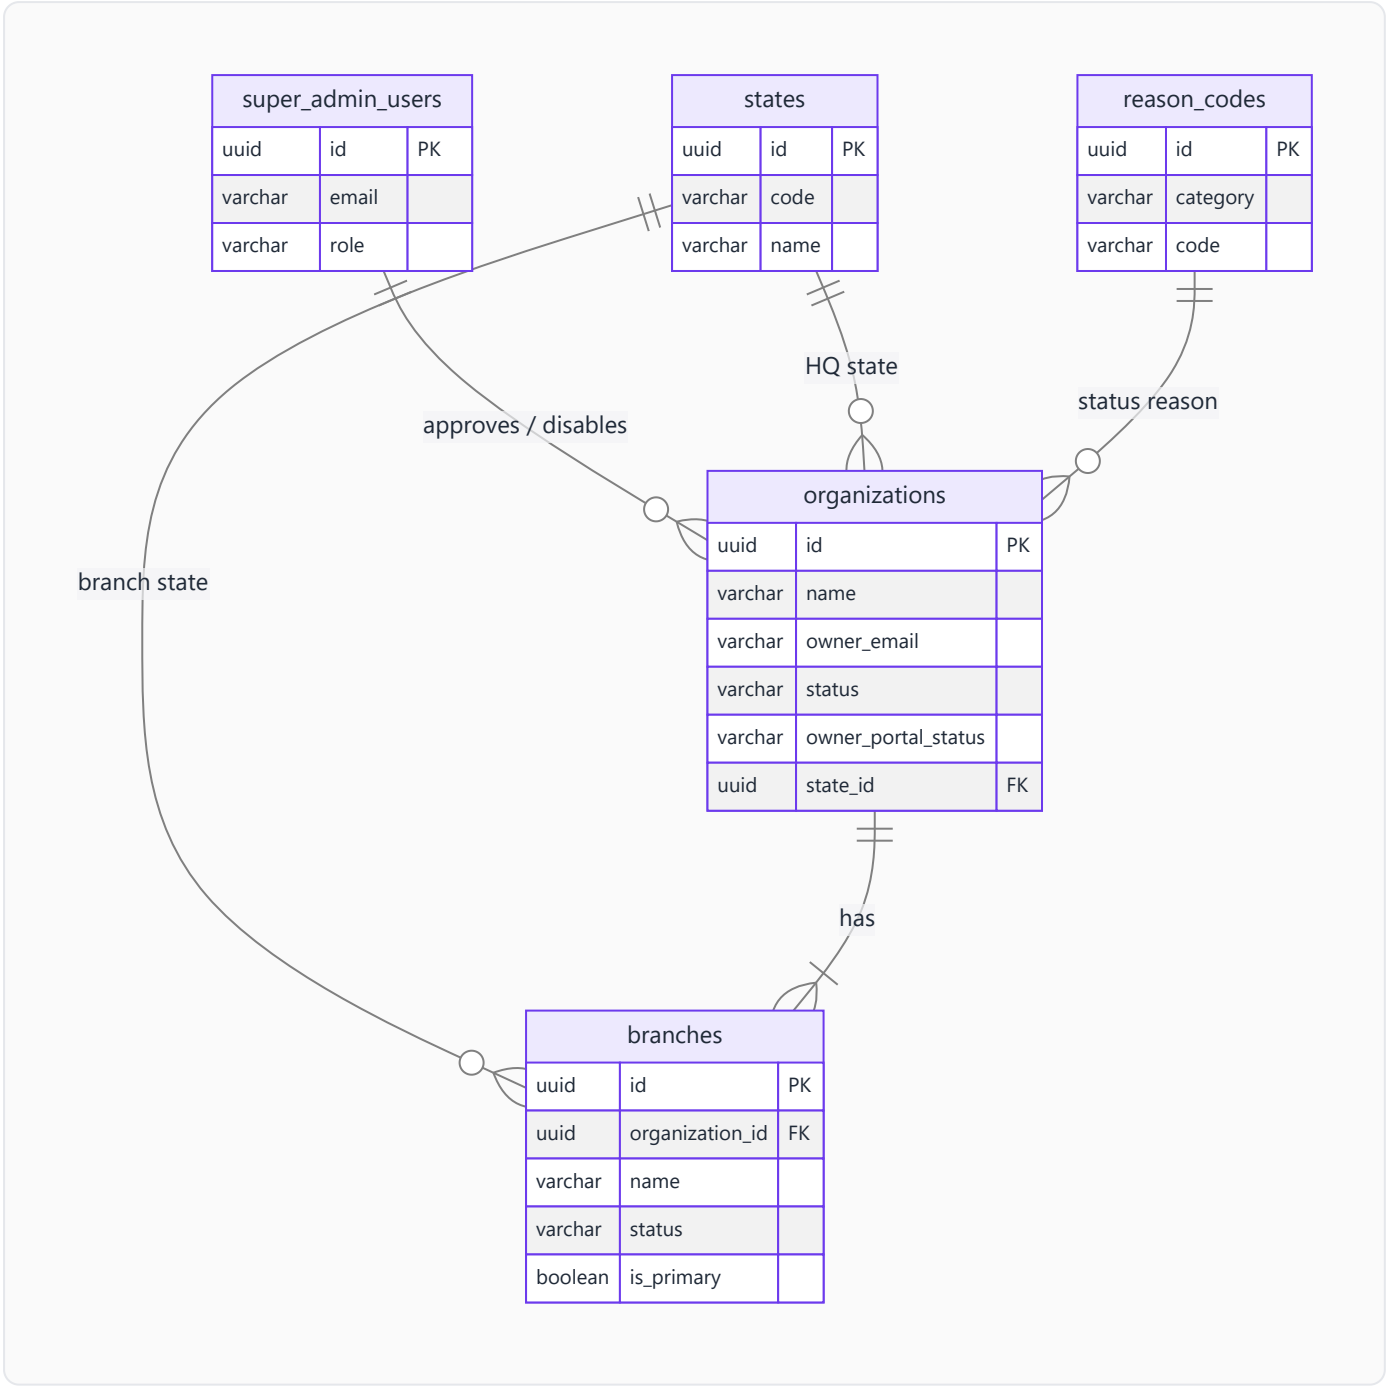

super_admin_users
uuid id PK
varchar email
varchar role
states
uuid id PK
varchar code
varchar name
reason_codes
uuid id PK
varchar category
varchar code
approves / disables
HQ state
status reason
branch state
organizations
uuid id PK
varchar name
varchar owner_email
varchar status
varchar owner_portal_status
uuid state_id FK
has
branches
uuid id PK
uuid organization_id FK
varchar name
varchar status
boolean is_primary

Table notes

Table	Explanation
`super_admin_users`	GlowTap ops accounts (SUPER_ADMIN, READ_ONLY, OPS_AGENT)
`states`	India state master for GST / tax
`organizations`	Salon business entity + owner (Salon Admin) fields
`branches`	Outlets; one primary per org; PENDING until approved
`reason_codes`	Suspend / Resume / Terminate reasons (org lifecycle)

4. Billing & subscriptions

Explanation

Catalog masters define **plans** and **billing cycles**. Each org has an `org_bill_structure` row (current commercial terms).

Invoices / payments / credit notes / refunds are the money ledger for SaaS fees (and `COMMISSION` invoices for marketplace cash settlement).

ER diagram

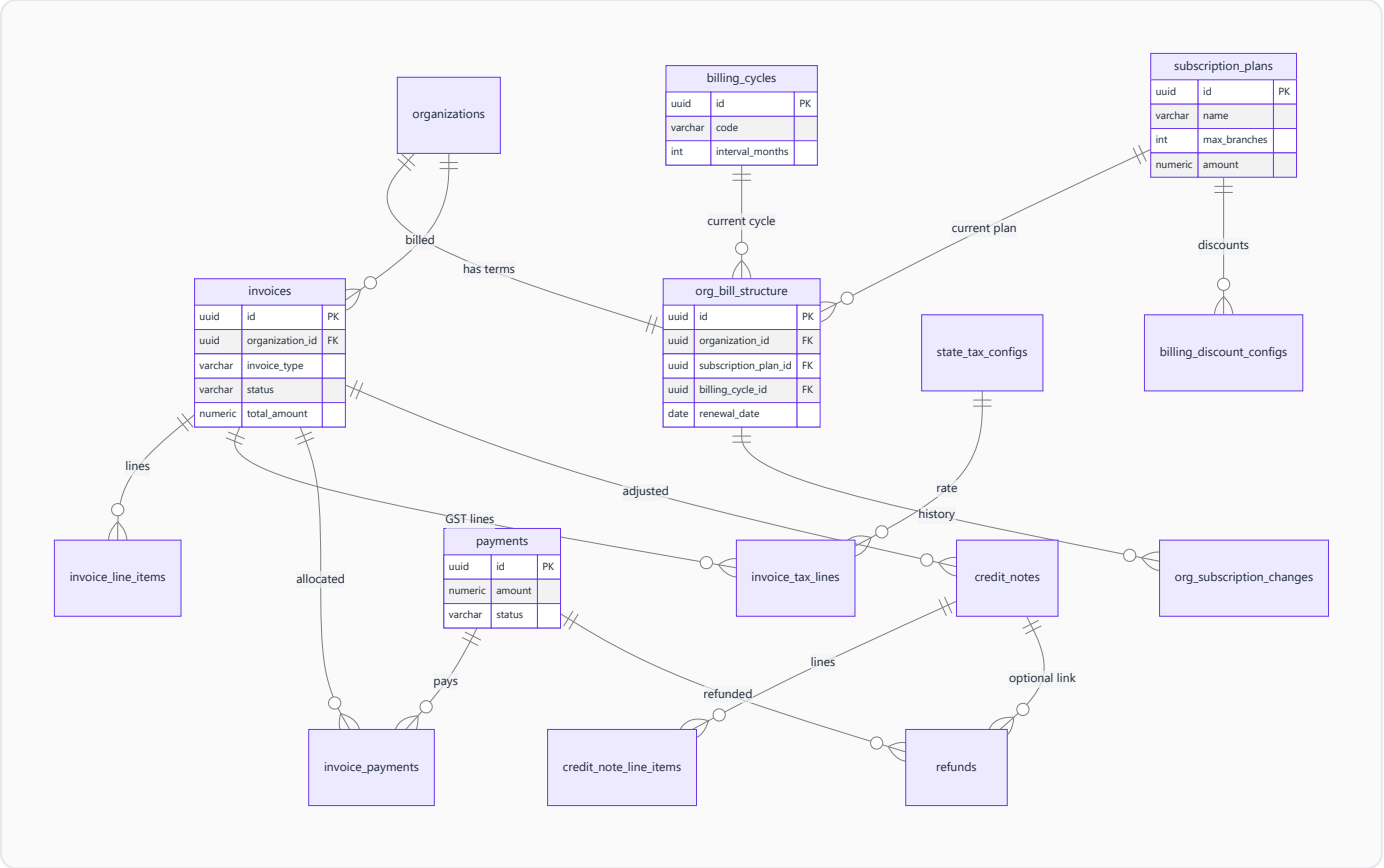

Table notes

Table	Explanation
`subscription_plans`	Starter / Growth / Professional / Enterprise
`billing_cycles`	Monthly, Quarterly, Half-yearly, Yearly
`org_bill_structure`	Live commercial terms per org
`billing_discount_configs`	Plan × cycle discount rules
`org_subscription_changes`	Upgrade / downgrade audit
`state_tax_configs`	GST rates by state
`invoices` + lines + tax lines	Invoice documents
`payments` + `invoice_payments`	Cash in + allocation
`credit_notes` + lines + `refunds`	Adjustments / refunds

5. Marketplace — B2C commission & payouts

Explanation

Tracks **customer → salon** money flows:

- **Cash / pay-at-salon** → commission accrues to **outstanding**
- **Online marketplace** → GlowTap collects; deducts commission, gateway fee, recovers outstanding; nets to salon via **payout**

Snapshot balances live on `org_merchant_balances`; history on `merchant_ledger_entries` (`OUTSTANDING` / `PAYABLE` buckets).

ER diagram

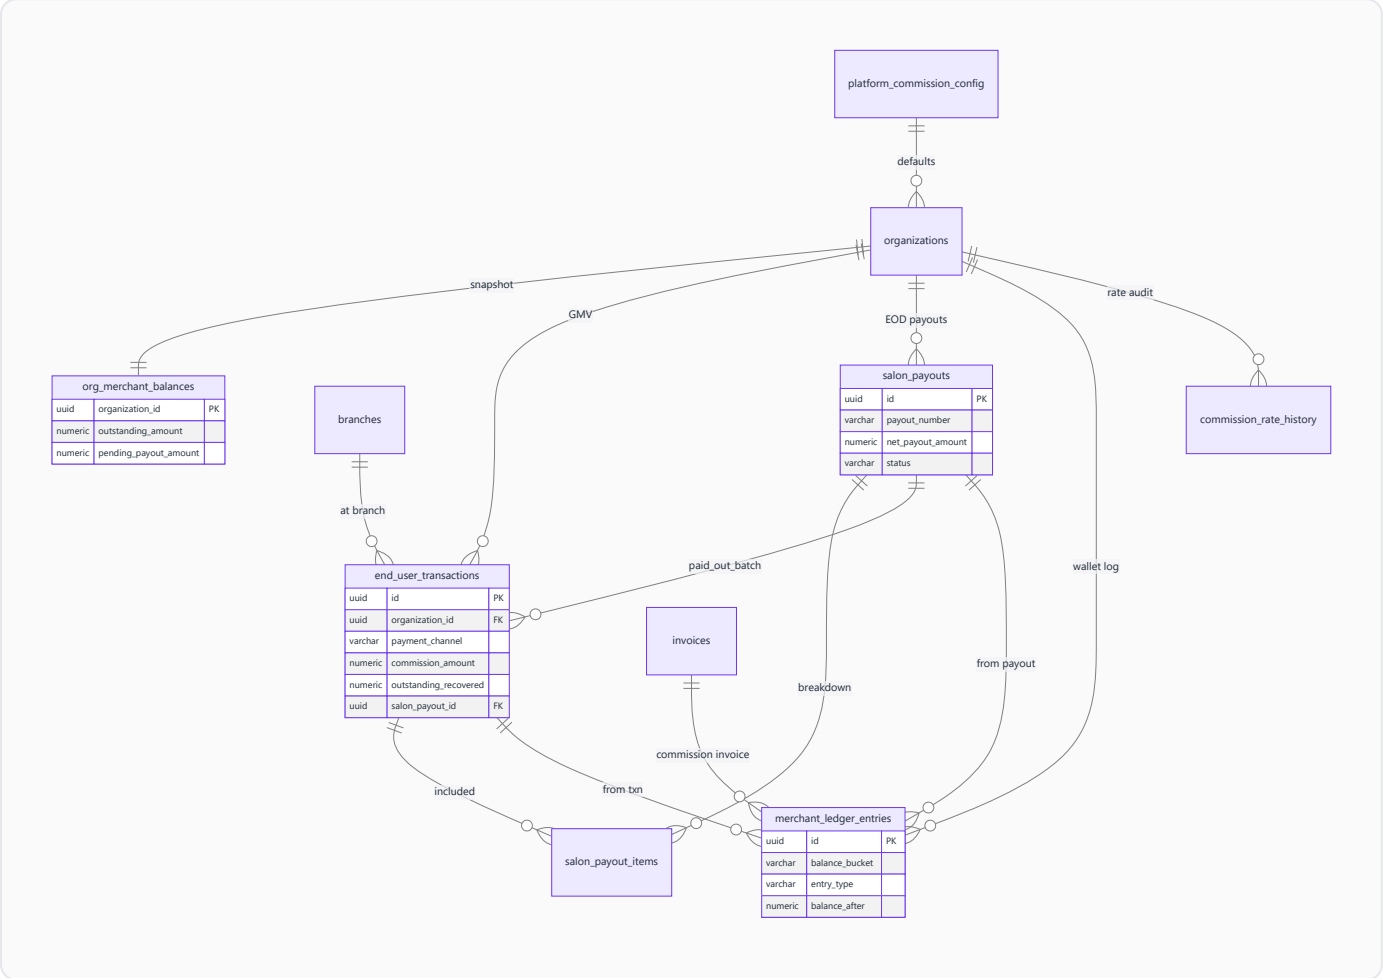

Table notes

Table	Explanation
`platform_commission_config`	Default %, invoice day, ₹5k threshold
`commission_rate_history`	Per-org rate changes
`end_user_transactions`	Each B2C booking payment
`org_merchant_balances`	Current outstanding + pending payout
`merchant_ledger_entries`	Append-only movements
`salon_payouts` / `salon_payout_items`	EOD transfer batch + lines

Outstanding = salon owes GlowTap (cash commission).

Payable = GlowTap owes salon (online net after recoveries).

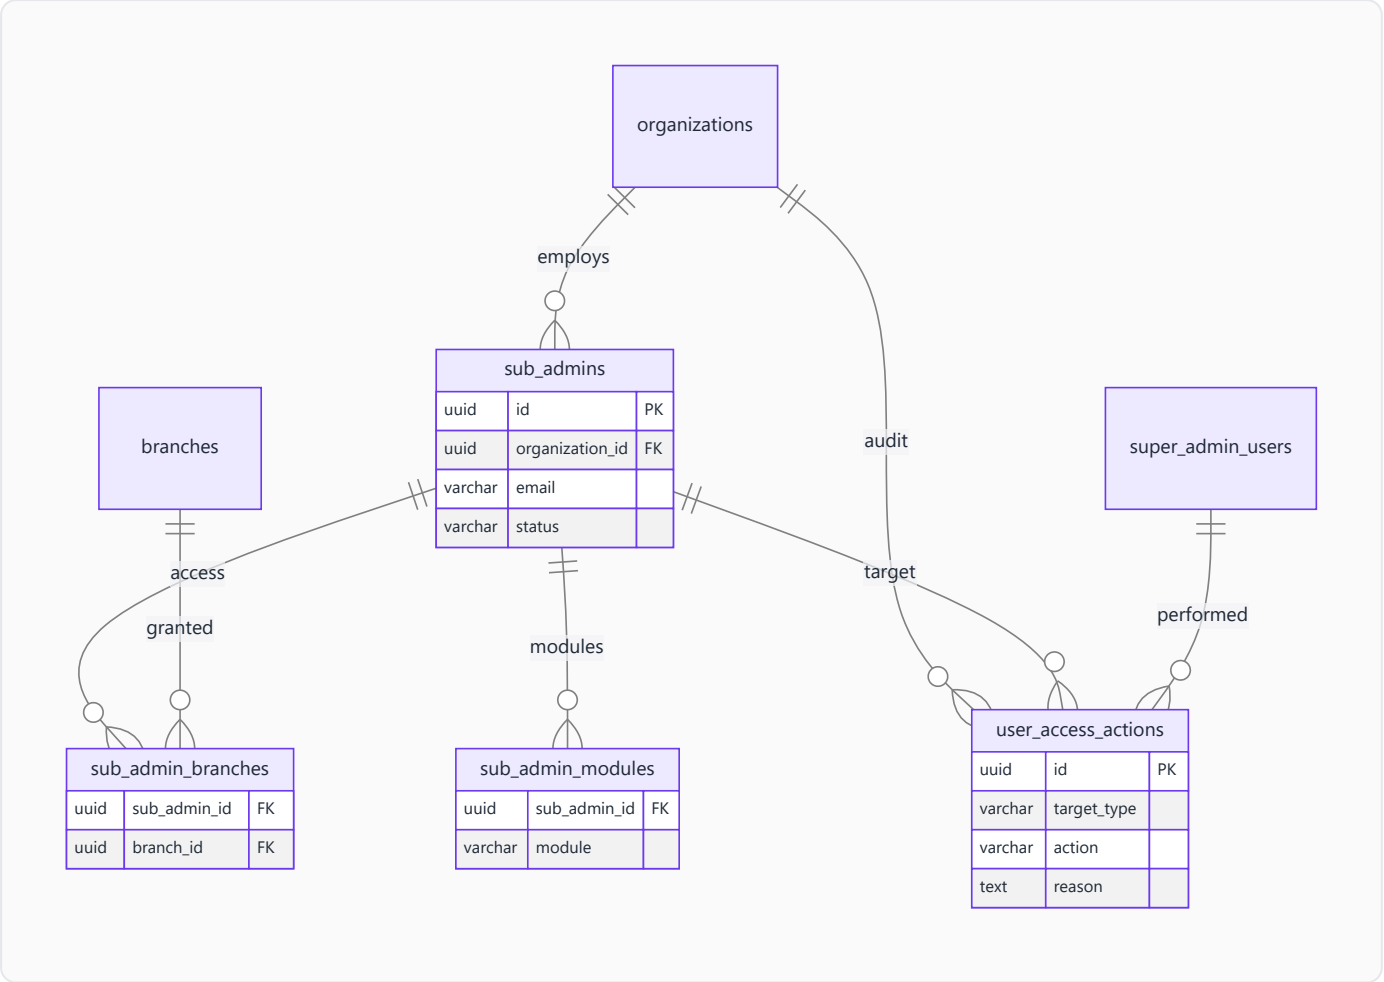

---

6. User Access Control

Explanation

- **Salon Admin** = org owner fields (`owner_*` + portal status)
- **Sub Admins** = delegated users under an org with **branch** + **module** grants
- Super Admin can disable; reasons go to `user_access_actions`

ER diagram

Modules (examples)

`BRANCH_PROFILE`, `EMPLOYEES`, `LEAVE_HOLIDAYS`, `ATTENDANCE`, `SERVICES`, `APPOINTMENTS`, `TRANSACTIONS`, `REPORTS`

---

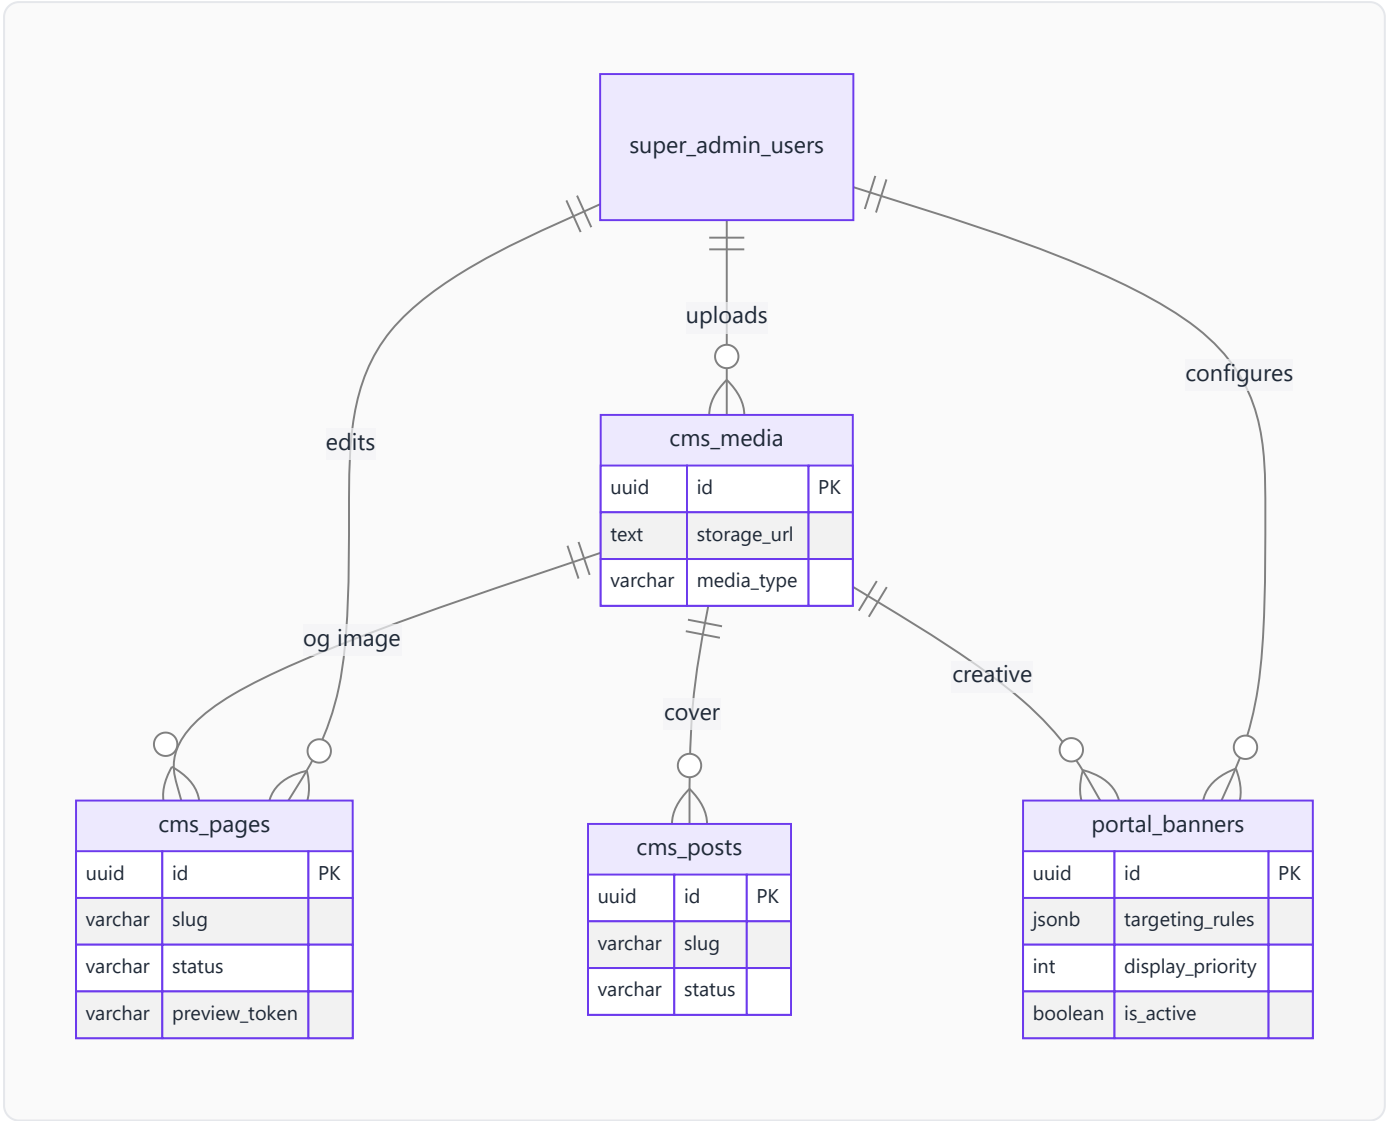

7. CMS & Salon portal banners

Explanation

CMS powers the public website (pages, blog, media).

Portal banners are promotional cards inside the **Salon Admin** app. Targeting is JSONB evaluated at runtime against org plan / expiry / branch limits (not stored per org).

ER diagram

Notes

- Publish workflow: `DRAFT` → `SCHEDULED` → `PUBLISHED`
- `preview_token` unlocks unpublished preview URLs
- Banner rules example: `{ "all": [ { "field": "days_to_expiry", "op": "lte", "value": 30 } ] }`

---

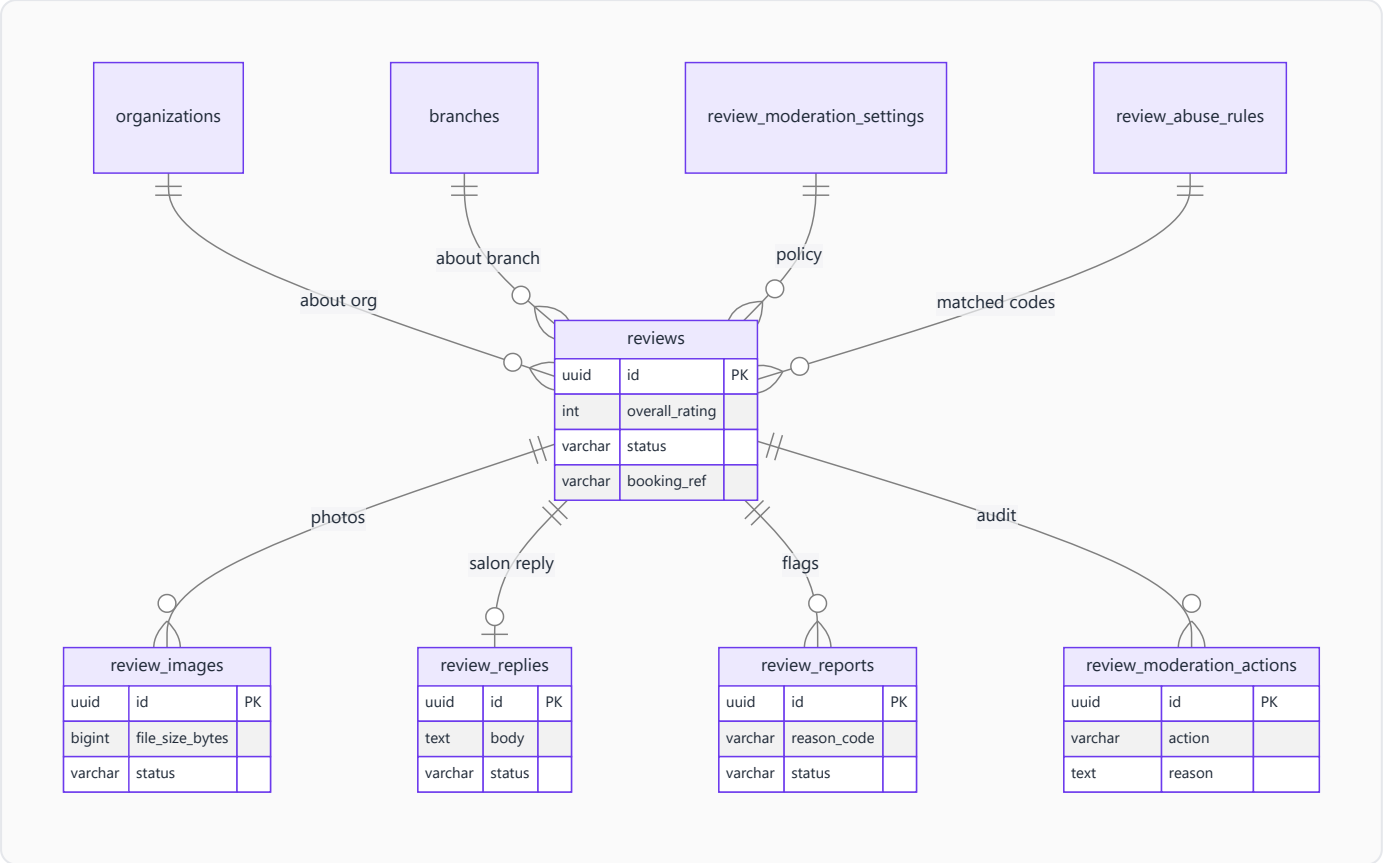

8. Reviews & ratings moderation

Explanation

Consumers submit reviews after completed bookings (soft `booking_ref`).

Super Admin configures **settings** + **abuse rules** (no ML), then moderates via queue / reports. Audit actions include `AUTO_APPROVE` vs human `APPROVE`.

ER diagram

Status flow

`PENDING` (queued) → `PUBLISHED` | `HIDDEN` | `REJECTED`

Public apps show only `PUBLISHED` (+ `ACTIVE` images).

---

9. Support & ticketing

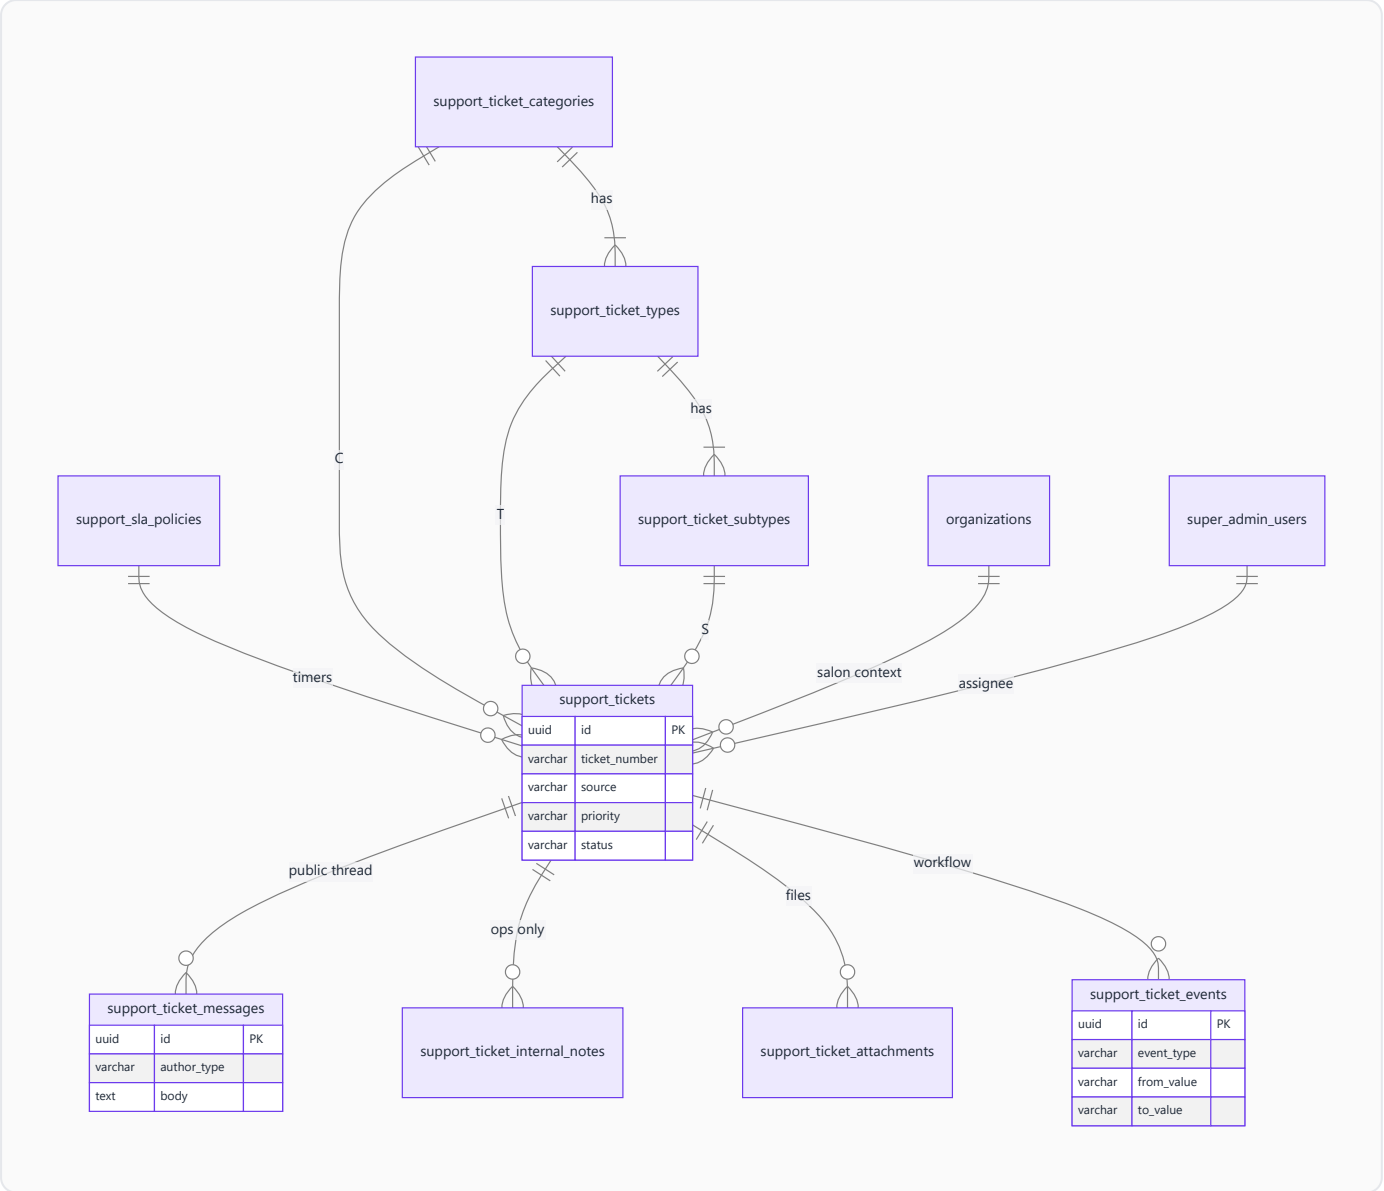

Explanation

SaaS helpdesk (Freshdesk-style). Tickets from **SALON** or **END_USER** (also SUPER_ADMIN / SYSTEM).

CTS = Category → Type → Subtype (audience-filtered).

SLA policies set first-response / resolve timers by priority.

ER diagram

Workflow

```
CREATED → IN_PROGRESS → ON_HOLD → AWAITING_USER → RESOLVED → CLOSED
                    ↑_____________________ REOPENED _______|
```

Messages support unlimited agent ↔ requester back-and-forth; events track status/assign history.

---

10. Service catalog taxonomy

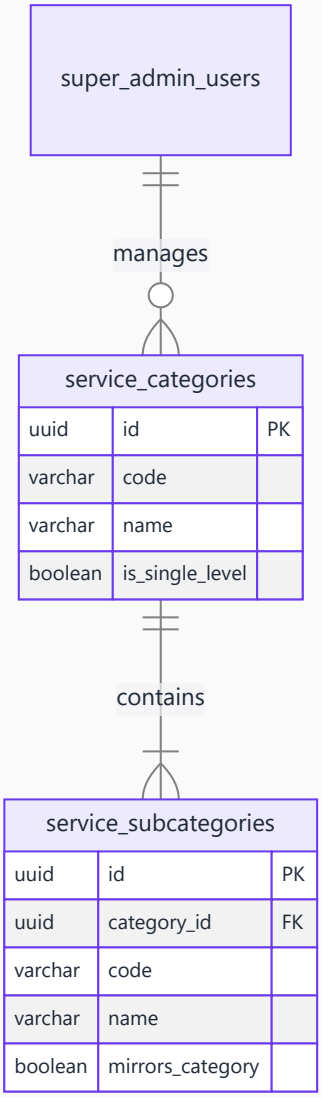

Explanation

Super Admin maintains a **2-level platform tree**: Category → Subcategory.

Salon product names (e.g. “Baba Hair Cut”) come later under a subcategory.

Single-level services: category name = subcategory name, **different IDs** (`is_single_level` / `mirrors_category`).

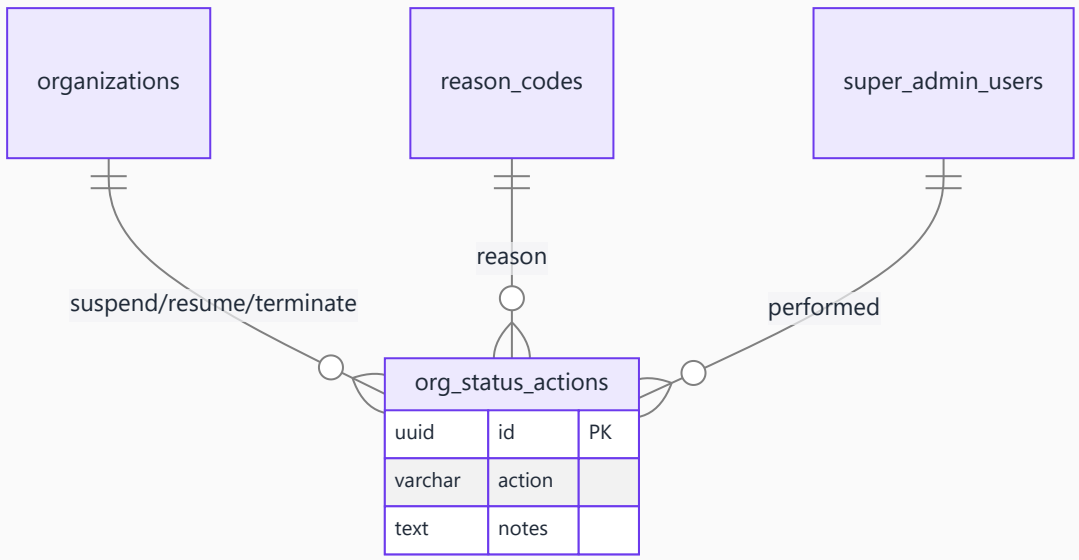

ER diagram

Examples

Category	Subcategories
Hair Cut	Men's, Women's
Spa	Spa *(mirrored single-level)*

11. Org lifecycle helpers

12. Cross-cutting conventions

Convention	Detail
PKs	UUID `gen_random_uuid()`
Timestamps	`timestamptz` (`created_at` / `updated_at`)
Money	`numeric(12,2)` , currency INR
Soft refs	`booking_ref` , `end_user_ref` , `specialist_ref` until modules land
Audit reasons	Prefer action/log tables (`user_access_actions` , `review_moderation_actions`) over denormalized reason columns
Indexes	All FKs indexed (migration 040 + 053)
RLS	Neon Data API policies on application tables

13. How to read these diagrams

In Mermaid ER notation (Crow’s foot style):

- **One-to-many (often mandatory children)** — double bar to crow's foot: `one ||--|{ many`
- **One-to-many optional** — double bar to open crow's foot: `one ||--o{ many`
- **One-to-one** — double bar both sides: `a ||--|| b`
- **One-to-zero-or-one** — double bar to open single: `a ||--o| b`

`||` = exactly one · `|` / `{` = many · `o` = optional (zero allowed)
